Working Group

- Envisioned is a WG under IG PID umbrella
- Develop a concept for persistent identification of instruments
- Focus on
 - Identifier type
 - Resolution of identifier onto landing pages describing instruments
 - Schema for metadata registration
- Case Statement for P11 Berlin

Current state of PIDs for active instruments

LOUISE DARROCH

BRITISH OCEANOGRAPHIC DATA CENTRE (BODC)
NATIONAL OCEANOGRAPHY CENTRE (NOC)

RDA Tenth Plenary Meeting, Montréal, Canada
19th-21st September 2017

Why PIDs?

It is customary to think that PIDs are only used to cite journals or datasets....

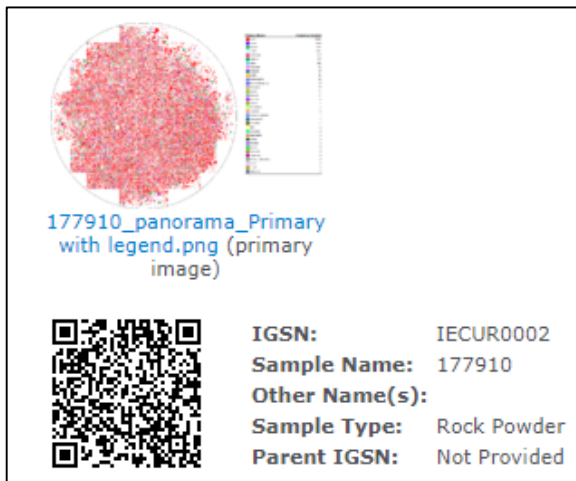

Classic example: Digital Object Identifier (DOI)

The screenshot shows the website for Aquatic Microbial Ecology. The top navigation bar includes links for Contact, Copyright and Disclaimer, Sitemap, and Search. The journal title 'AQUATIC MICROBIAL ECOLOGY' is displayed in a logo, with 'Inter-Research Aquatic Microbial Ecology' as a subtitle. A breadcrumb trail indicates the current page: 'You are at: Inter-Research > AME > v74 > n2 > p173-185'. Below this, the article title 'AME 74:173-185 (2015)' is followed by a DOI link: 'DOI: https://doi.org/10.3354/ame01735', which is circled in red. The article title is 'Effect of short-term light- and UV-stress on DMSP, DMS, and DMSP lyase activity in *Emiliania huxleyi*'. The authors listed are Louise J. Darroch^{1,6}, Michel Lavoie¹, Maurice Levasseur^{1,*}, Isabelle Laurion², William G. Sunda³, Sonia Michaud⁴, Michael Scarratt⁴, Michel Gosselin⁵, and Gitane Caron¹. Footnotes provide affiliations for each author, including Université Laval, Institut national de la recherche scientifique, Beaufort Laboratory, Maurice Lamontagne Institute, and Institut des sciences de la mer.

How PIDs are being used

Increasingly, PIDs are being used to universally locate and identify physical things or events

Audit trail

- Linking to the associated metadata about an analytical result is important in some regulated industries (traceability)
- Preventing mix-ups and editing errors gives assurance to data (e.g. climate change studies -> policy)

Audit trail

- Advances in technology mean we are generating more data than ever
- Linking to associated metadata helps us quickly determine if sensors are fit for purpose
- It also enables machines to automate and aggregate sensors and information

What metadata already exists?

- What existing metadata could be resolved under a PID for an instrument instance?
- Many established lists of standardised terms (controlled vocabularies) already in use, especially in the marine domain. E.g.

↑ -- Hitachi U3010 UV-Visible scanning spectrophotometer --

URI	http://vocab.nerc.ac.uk/collection/L22/current/TOOL0824/
Identifier ()	SDN:L22::TOOL0824
Preferred label (en)	Hitachi U3010 UV-Visible scanning spectrophotometer
Alternative label (en)	Hitachi U3010 spectrophotometer
Definition (en)	A bench-top scanning spectrophotometer which operates in the UV-visible wavelength range (190 nm - 900 nm). It is fitted with a grating single monochromator (Seya-Namioka mount) which reduces stray light to 0.015%. Sample volumes as small as 5 uL can be analysed.

database and
data files

EU Oceans of Tomorrow

- Recently, the SenseOCEAN project used PIDs to locate, resolve and link SensorML (and RDF/XML/SSN) sensor instance descriptions
- They were used to help cut down transmission costs from in-situ sensors
- This was done using a resolvable Universally Unique Identifier (UUID)

http://linkedsystems.uk/system/instance/TOOL0969_1234/current/

Summary

- PIDs are increasingly being used to identify things or events
- Many different PID types are used to identify instruments and things associated to instruments
- There is no universal agreement on one method
- Benefits in linking an active device to associated metadata (e.g. traceability, machine automation)
- Controlled vocabularies to describe metadata associated to sensor instances exist, especially in the marine domain
- Defined metadata schemas are being used for publishing sensor model and instance descriptions on the Semantic Sensor Web

The Research Data Life Cycle

data intensive research is highly collaborative

- scientists share data already in an early research state
- ad hoc techniques for sharing are often prohibitive
- reliable references can accelerate the Research Life Cycle

The ePIC Members

build a network of currently six strong scientific service providers that signed a contract

- to **ensure a reliable and persistent identifier infrastructure**
- devoted to the needs of the research community at large.

Major focus: the referability of data

- for sharing during the research process
- with finer granularity and
- PID coupled metadata (PID InfoTypes)

Quality of Service in ePIC

- Conditions of Operation
 - user management, privacy protection and secrecy
- incident management and monitoring
- support system with agreed responsibilities
- certification of ePIC PID services
- several policies for PID minting and update agreed
 - others are still under discussion
- quality of resolution
 - audits can be requested
- community dependend policies (on prefix level)

Sharing Data in Research

Introduction
to ePIC

Ulrich
Schwardmann

- data sharing of early results requires
 - a reliable framework of trust
 - transparent and standardized policies
 - registration for referable data
 - stable references
 - **strong coupling between data and metadata**

PIDs can be the pivot to fulfil these requirements

ePIC

Data Types

Data Type
Registries

PID Information Types

- are additional metadata stored in the PID database
- intended to be directly accessible independent of any redirection
- typical cases are
 - checksum
 - mime type (incl. version)
 - embargo time
 - expiration date
 - add. metadata file
 - basic Dublin Core
 - access methods, data formats

Granularity

digital objects shared with other scientists for investigation often have a *finer granularity*

- use cases are
 - single experiments
 - simulation output and/or parameter sets
 - single files, tables, pictures, single scanned pages or video/audio sequences
 - sensor outputs (snapshots, dynamic data)
 - software and software versions
- the minting of a huge number of PIDs can be necessary (and favorable)
- in some cases these sets of digital objects are highly structured
 - and accessible by parameterized services
 - this must be recognizable by data types
 - here also *templates* or *fragment identifiers* can be a solution

Templates or Fragment Identifier

rules for strings appended to the PID (see IETF RFC 6570)

- often used to address *service functions* operating on digital objects
- the template implementation in the handle system is simply a rewrite rule
- delimiter and replacement is configurable at prefix level
- *example*
 - delimiter is @, which is replaced by ?
11858/00-ZZZZ-0000-0001-CCD1-4@aaa=bbb&ccc=ddd
 - translates into:
`http://wwwuser.gwdg.de/~tkalman/downloads
/formtest.php?aaa=bbb&ccc=ddd`
- be **careful**: fragment identifier are much **less persistent** than the PIDs itself
- the rewrite rule can be much more complex:
 - replace semantic string elements like URLs by other strings
 - use delimiter strings instead of characters

Data Type Registries

- The PID Information Type (PIT) definitions are kept in Data Type Registries (DTRs).
- Currently a couple of such DTRs exist,
 - based on a software called *Cordra*¹, developed from a RDA WG outcome,
 - using a special vocabular for type specifications.
 - This vocabular is partly extended for the purpose of the development presented here.
- ePIC also runs such a DTR
- Interoperability: a process of standardisation and federation for DTRs is ongoing.

Questions ???

Contact@ePIC:

- support@pidconsortium.eu

Contact@GWDG:

- **Ulrich Schwardmann**

T: 0551 201-1542, E: ulrich.schwardmann@gwdg.de

- Focus on
 - Identifier type
 - Resolution of identifier onto landing pages describing instruments
 - Schema for metadata registration
 - Content negotiation and machine readability
- Many projects (in Earth science) building “sensor registries”
 - Can this WG lay the foundations for a global instrument registry?
 - Deliver a recommendation for an organization to implement, run service
- Instruments, great but
 - Also platforms and deployments
 - Links between them
- Involving manufacturers
 - Do we need to involve them
 - Should they register instruments and provide landing pages
- PID type and resolution mechanism: Existing or new?
- Involve disciplines: earth science, astronomy, life sciences, chemistry,
- Co-chair from US/Australia
